

ASP.NET Core Web App (MVC)

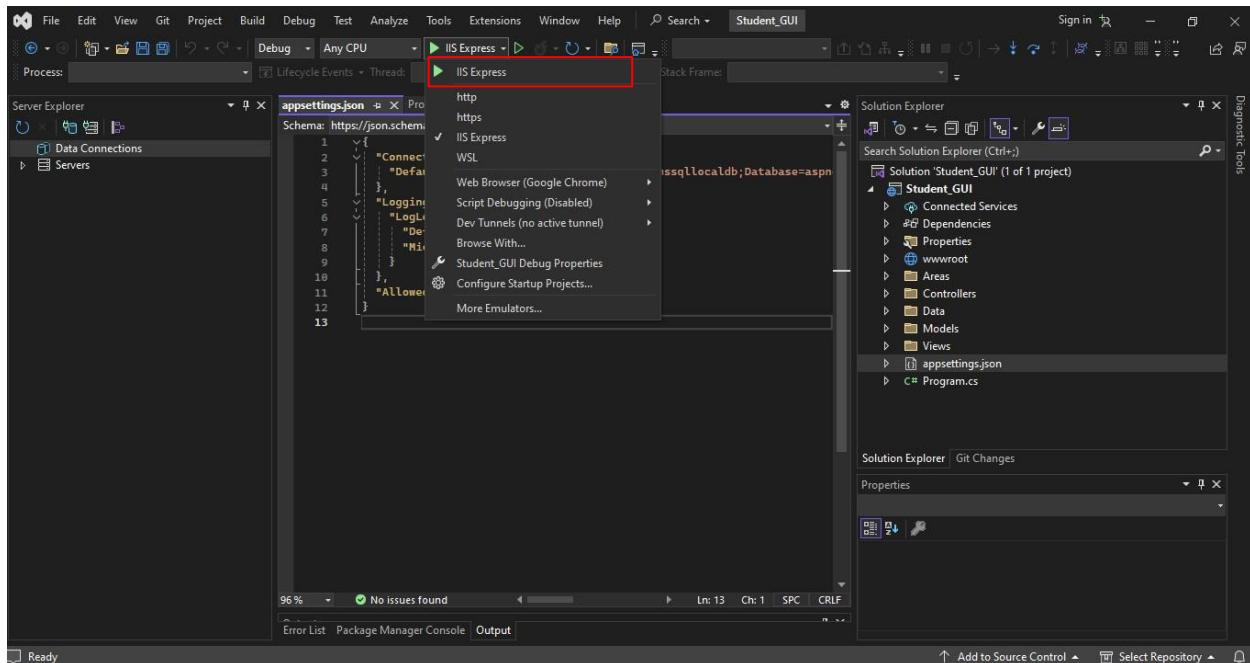

Project Name: **Student_GUI**

Select IIS Express then RUN

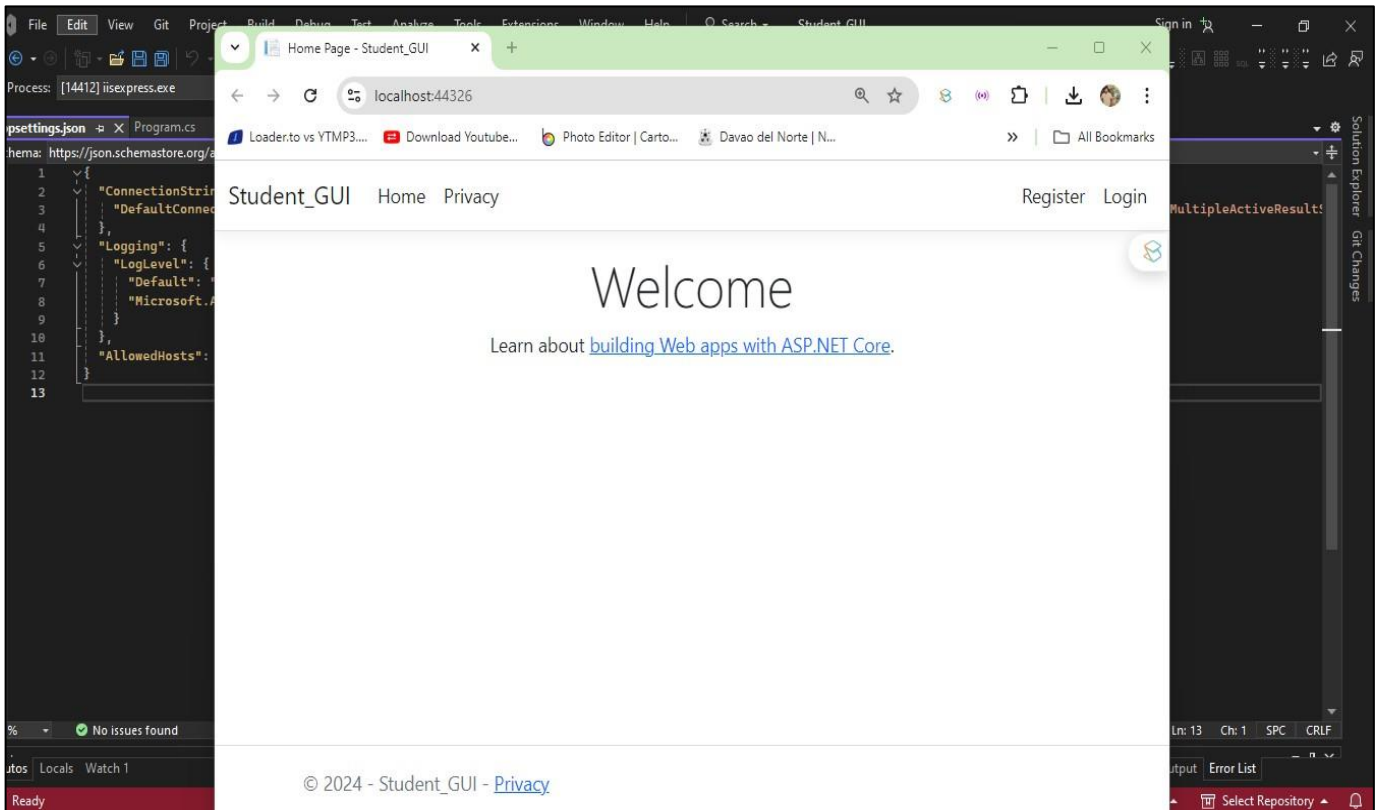

IIS Express (Internet Information Services Express) is a lightweight, self-contained version of Microsoft's **IIS (Internet Information Services)** designed for development and testing purposes. It allows developers to run and test web applications locally without needing a full IIS setup.

Key Features of IIS Express

1. **Lightweight** – Easier to set up than full IIS.
2. **Runs Without Administrator Privileges** – Unlike full IIS, it can be run as a normal user.
3. **Supports Multiple Versions of .NET** – Works with ASP.NET Core, ASP.NET MVC, and Web Forms.
4. **Uses the Same IIS Modules** – Provides similar functionality to full IIS.
5. **Integrates with Visual Studio** – Visual Studio can automatically launch IIS Express for debugging.

Web Page - WELCOME

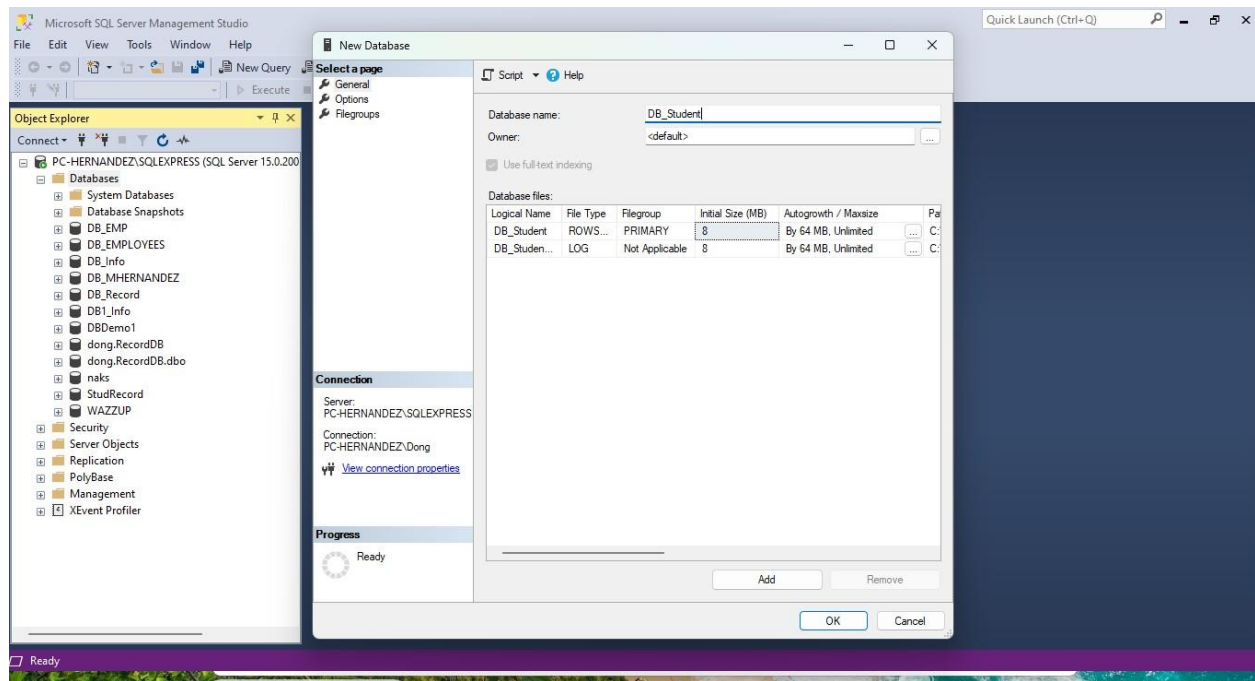

- ◆ **Model** → Represents data and business logic.
- ◆ **View** → The UI (HTML, CSS, Razor) that displays the data.
- ◆ **Controller** → Handles user requests and updates the Model & View.

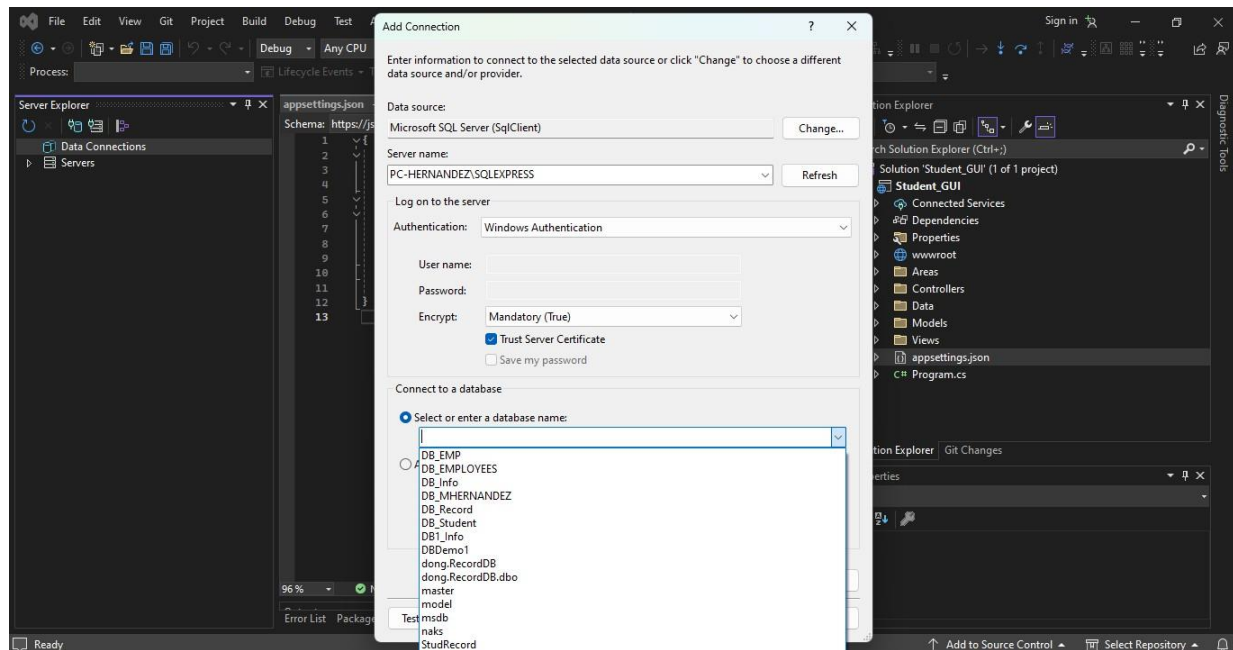

Ex.

- Model (StudentInfo.cs)** → Represents product data.
- Controller (StudentInfo Controller.cs)** → Handles logic and passes data to views.
- View (Index.cshtml, Details.cshtml)** → Displays the product list and details.

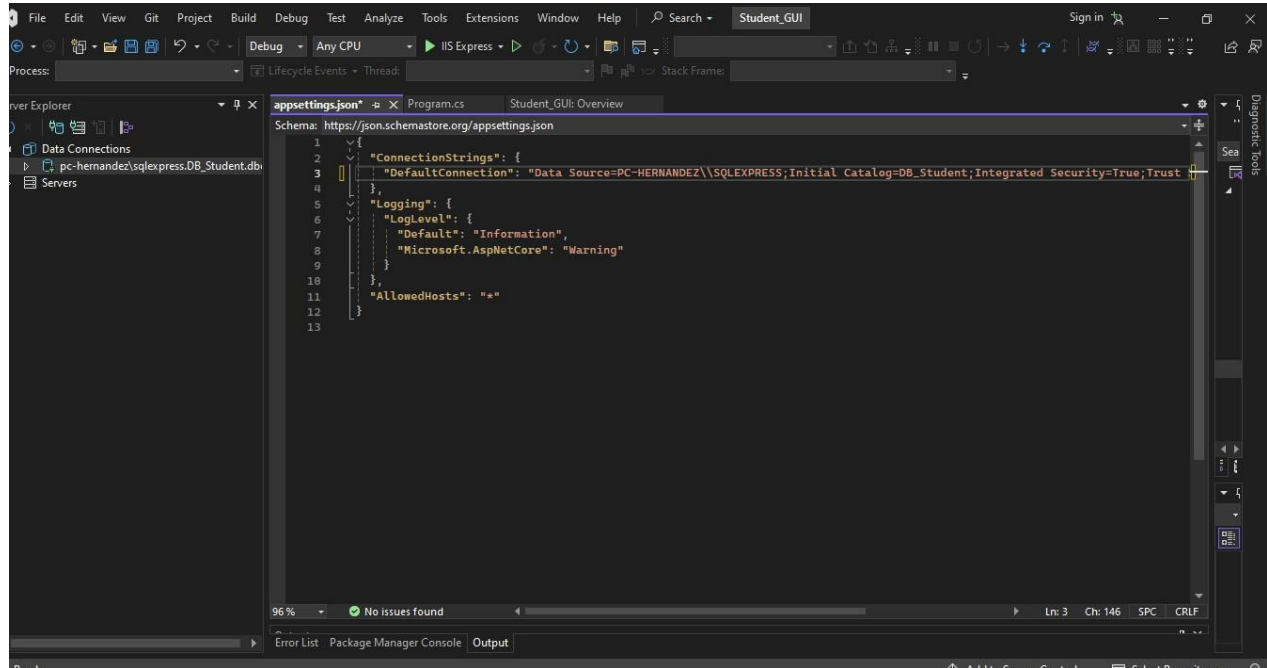

Create database – DB_Student

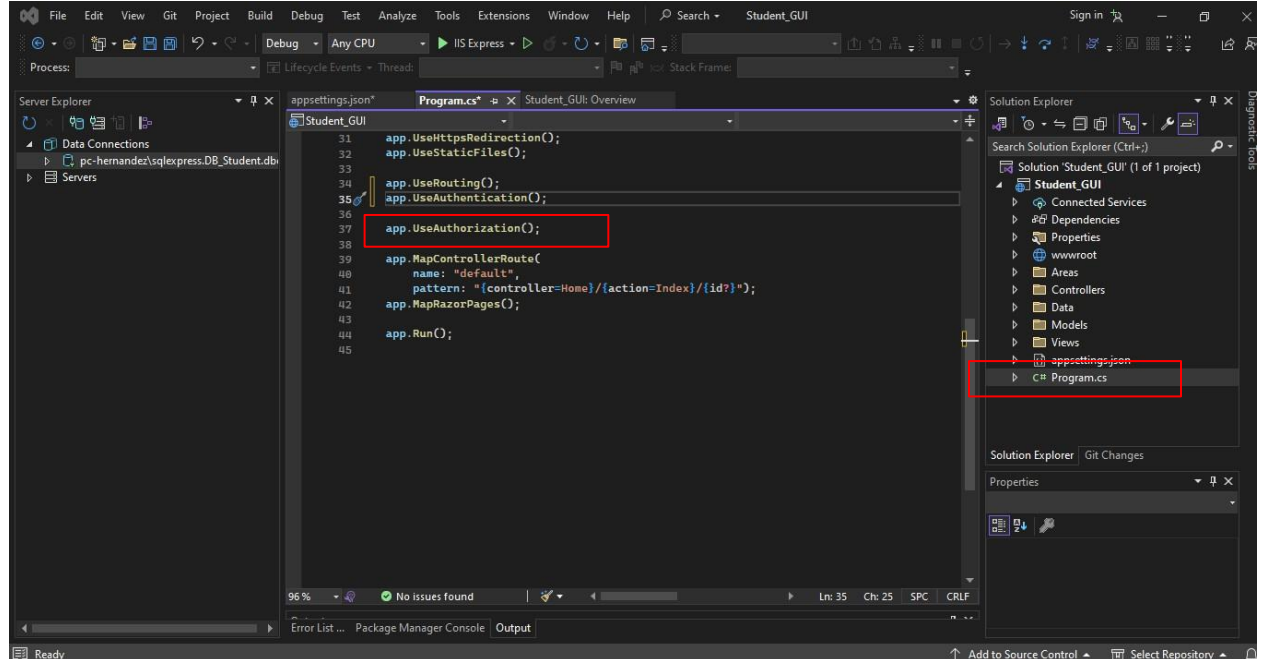

Refresh and select the Database – DB_Student

Copy and Paste the String Connection

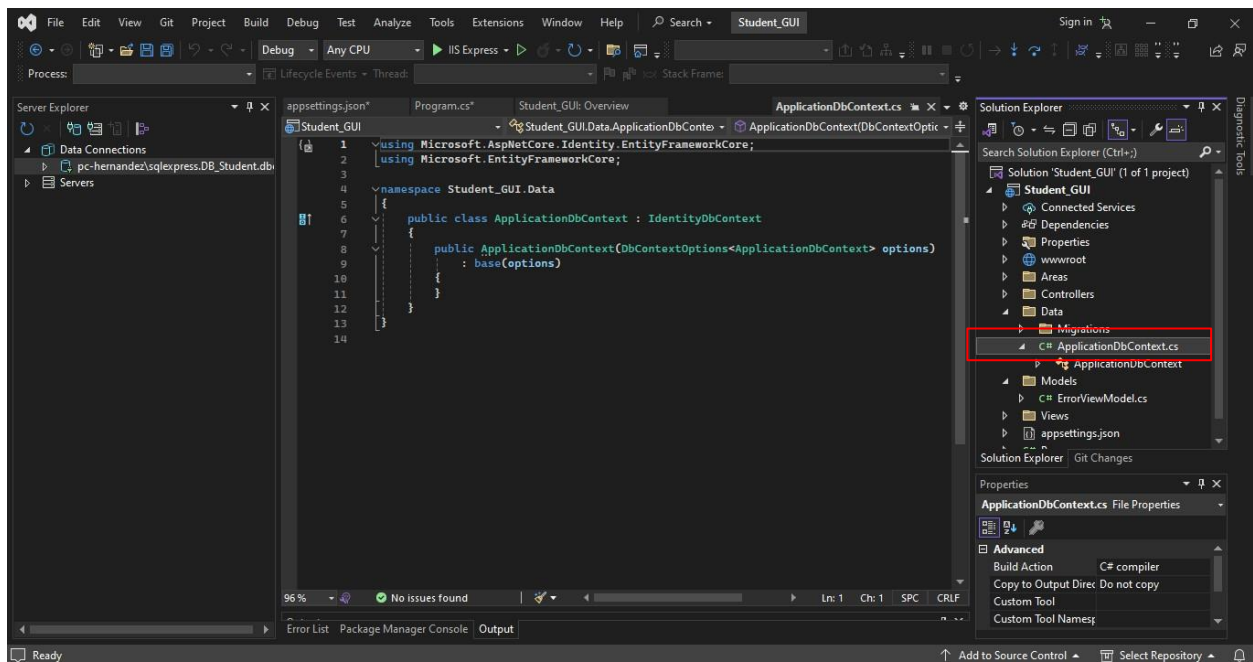

Add `app.UseAuthorization();`

`app.UseAuthorization();` is a middleware component in ASP.NET Core that enables **authorization** in the request pipeline. It ensures that users have the right permissions to access specific parts of the application.

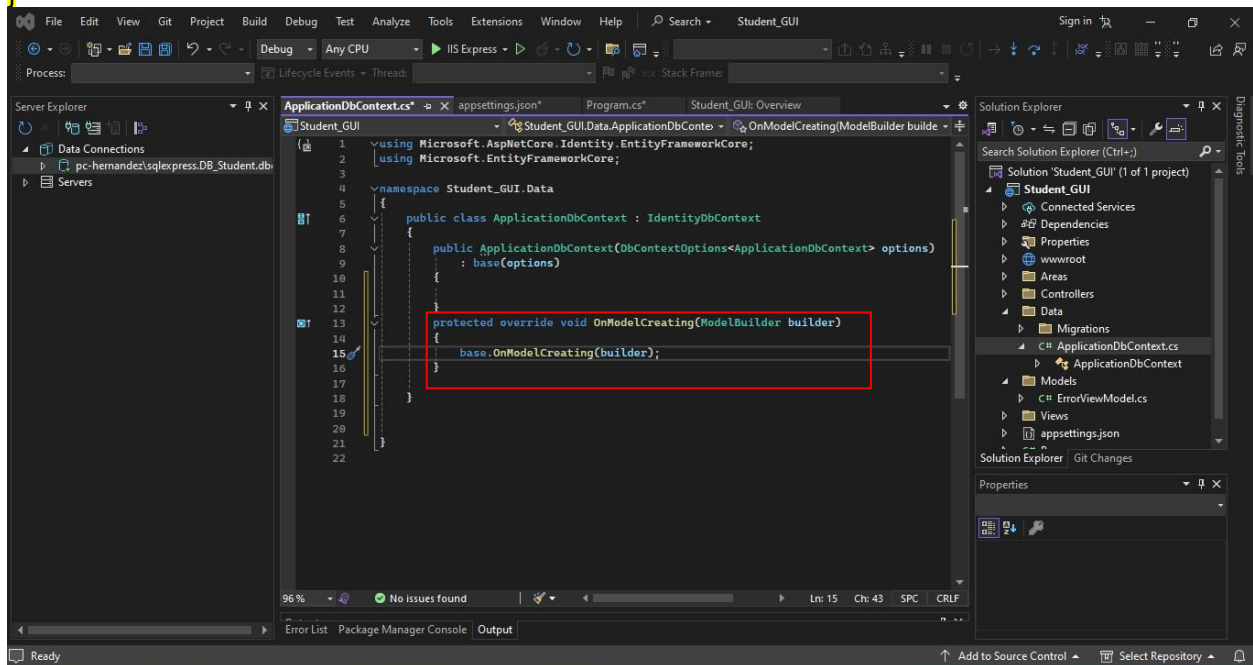

How It Works

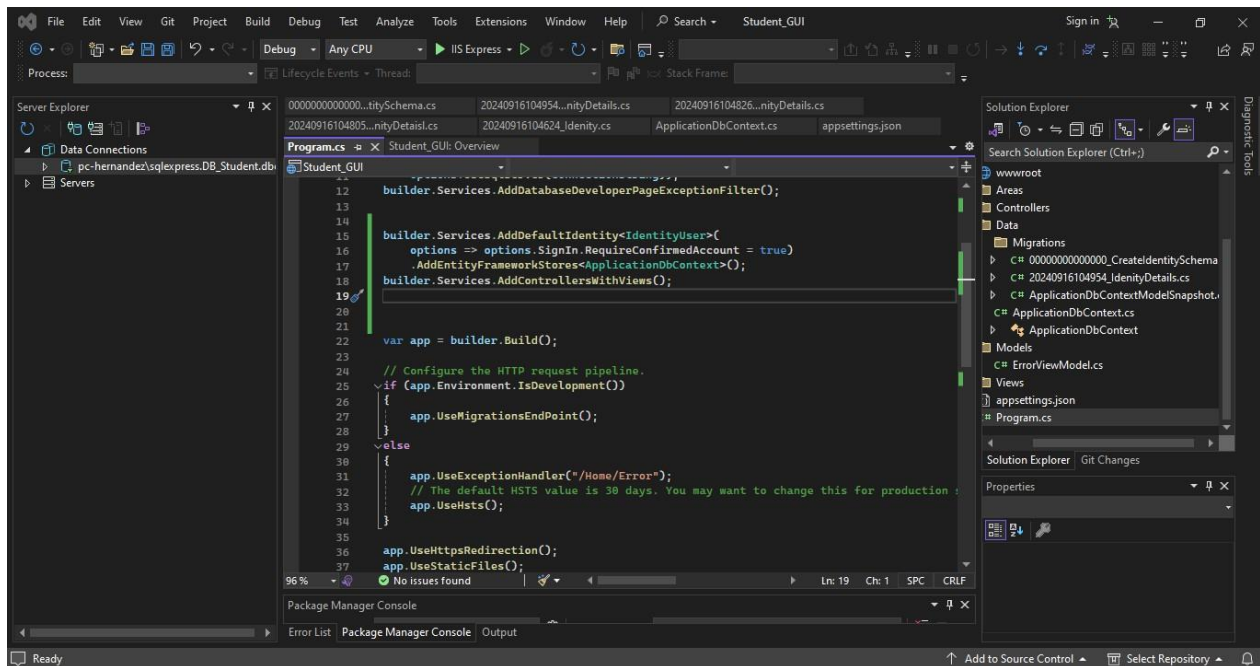

- **Authorization** checks whether a user is allowed to perform an action.
- It works **after authentication** (i.e., verifying who the user is).
- `app.UseAuthorization();` must be placed **after** `app.UseAuthentication();` in the middleware pipeline.

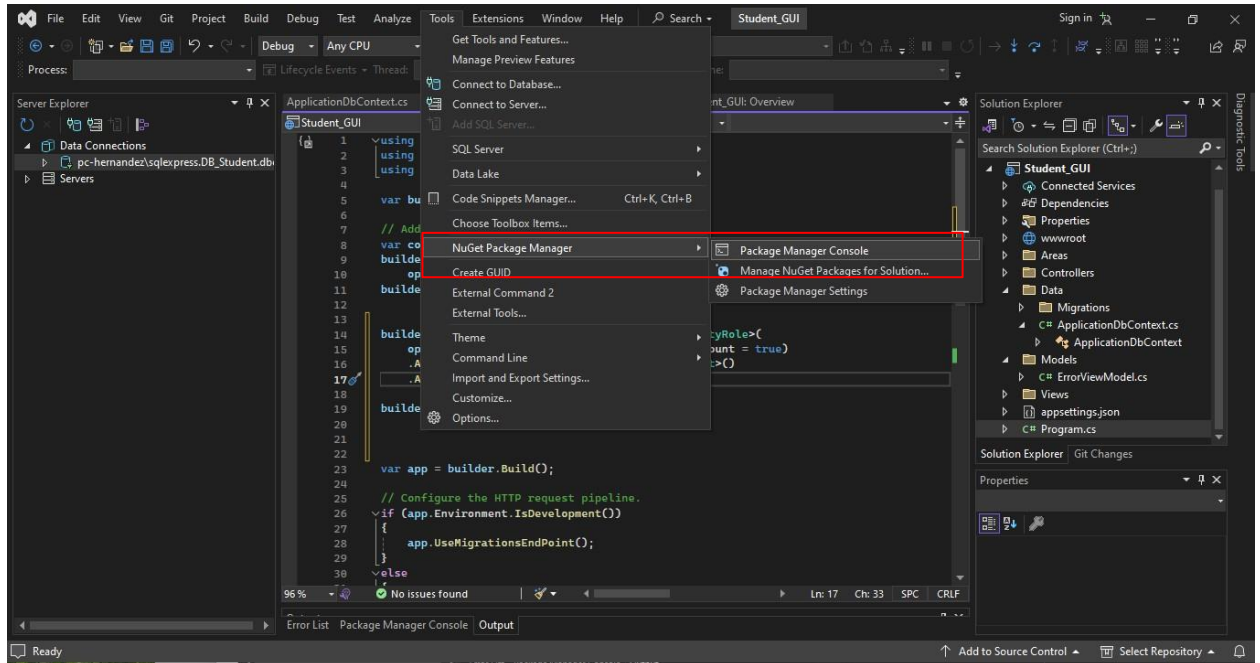

Type protected override void OnModelCreating(ModelBuilder builder)

```
{
    base.OnModelCreating (builder);
}
```

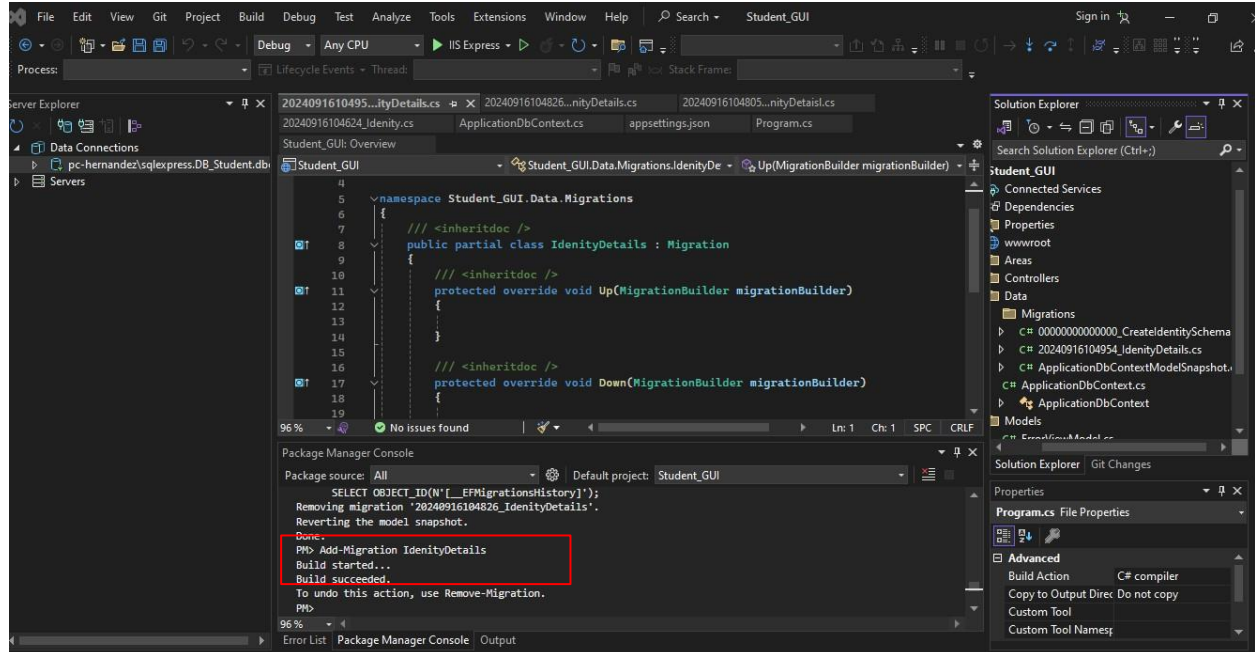

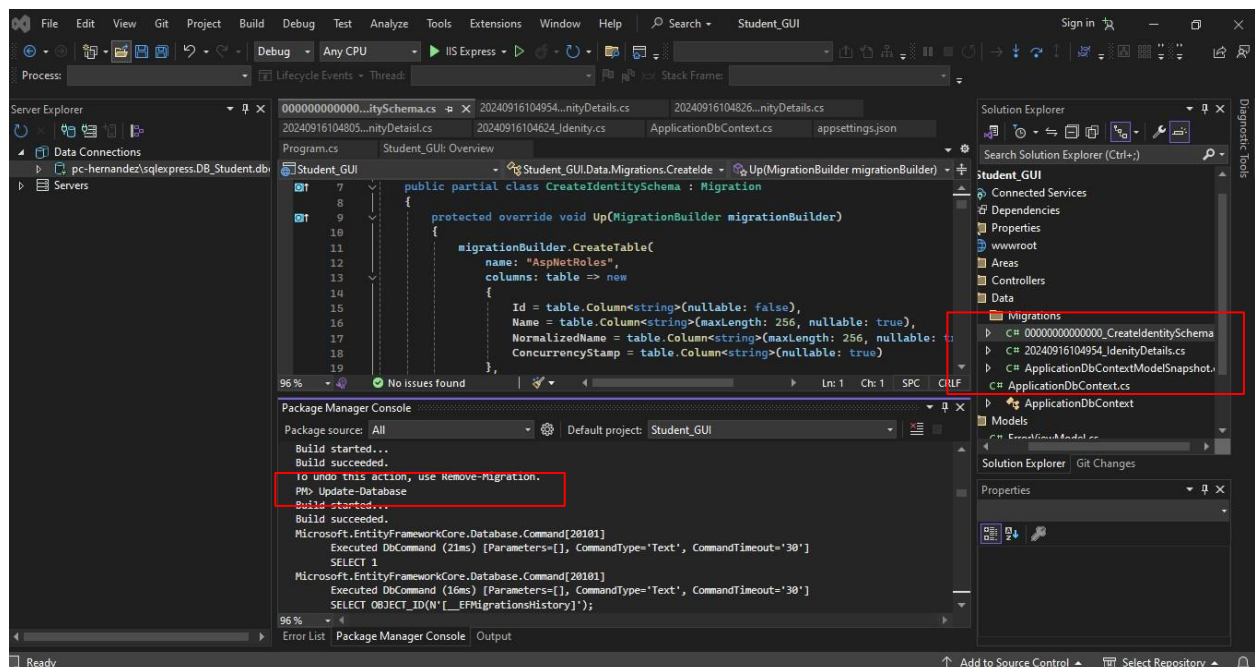

Open NuGet Package Manager – Package Manager Console

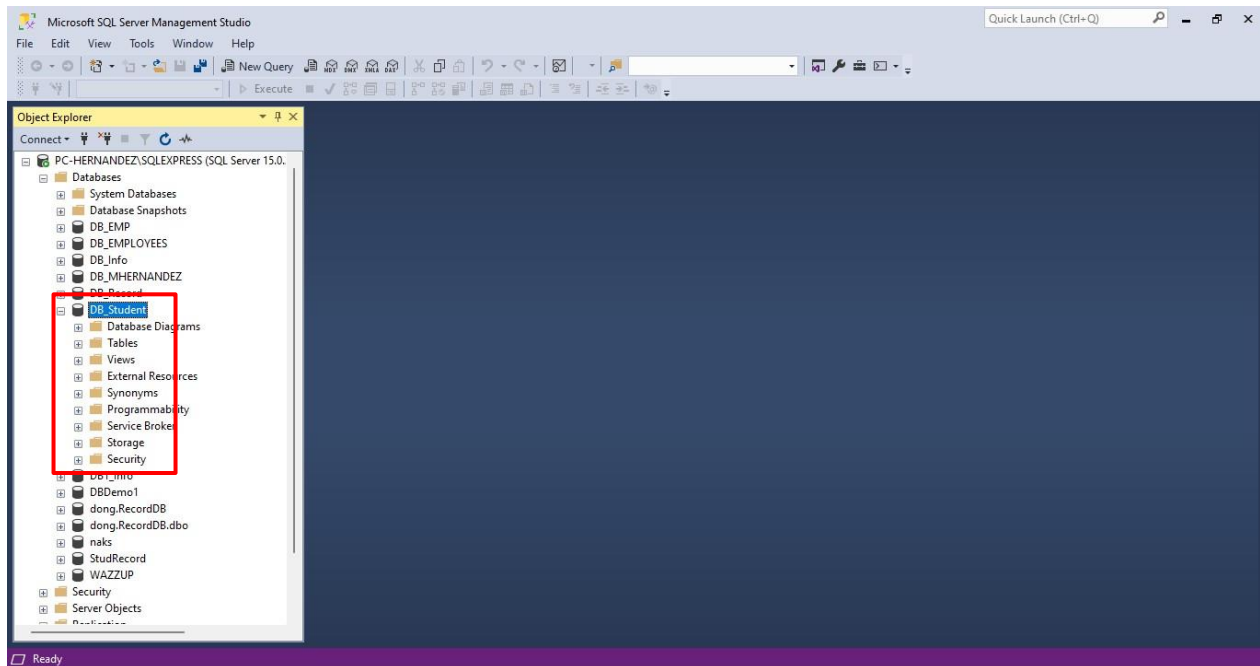

Console – type Add-Migration IdentityDetails

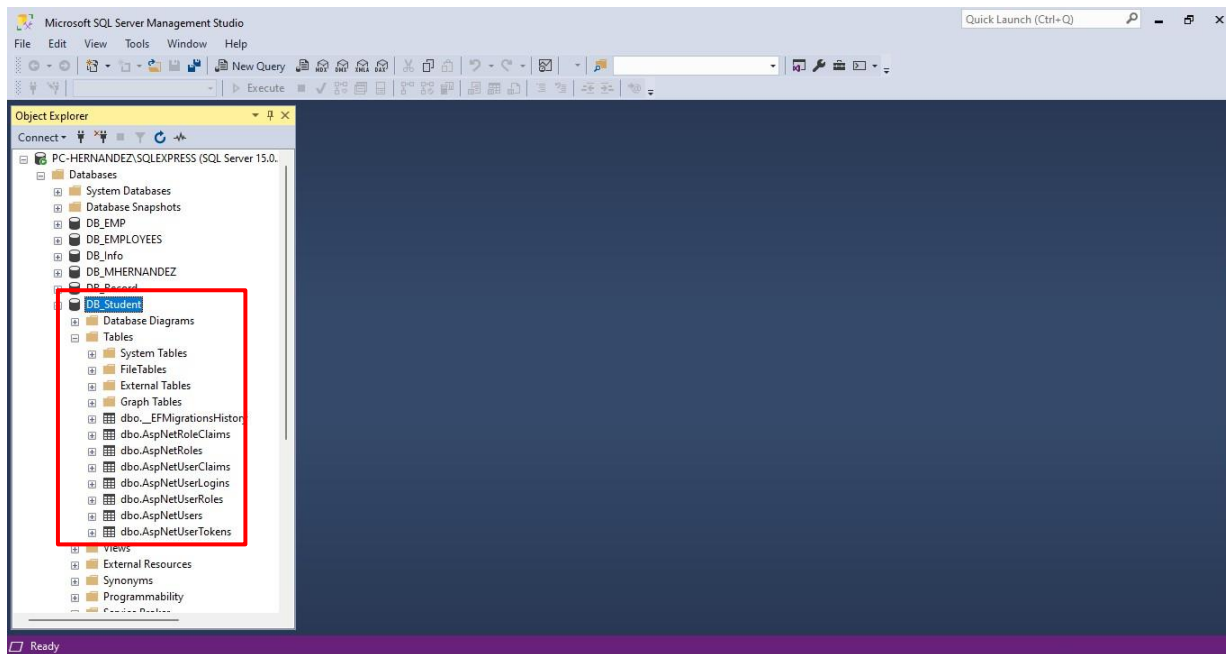

Console – type Update-Database

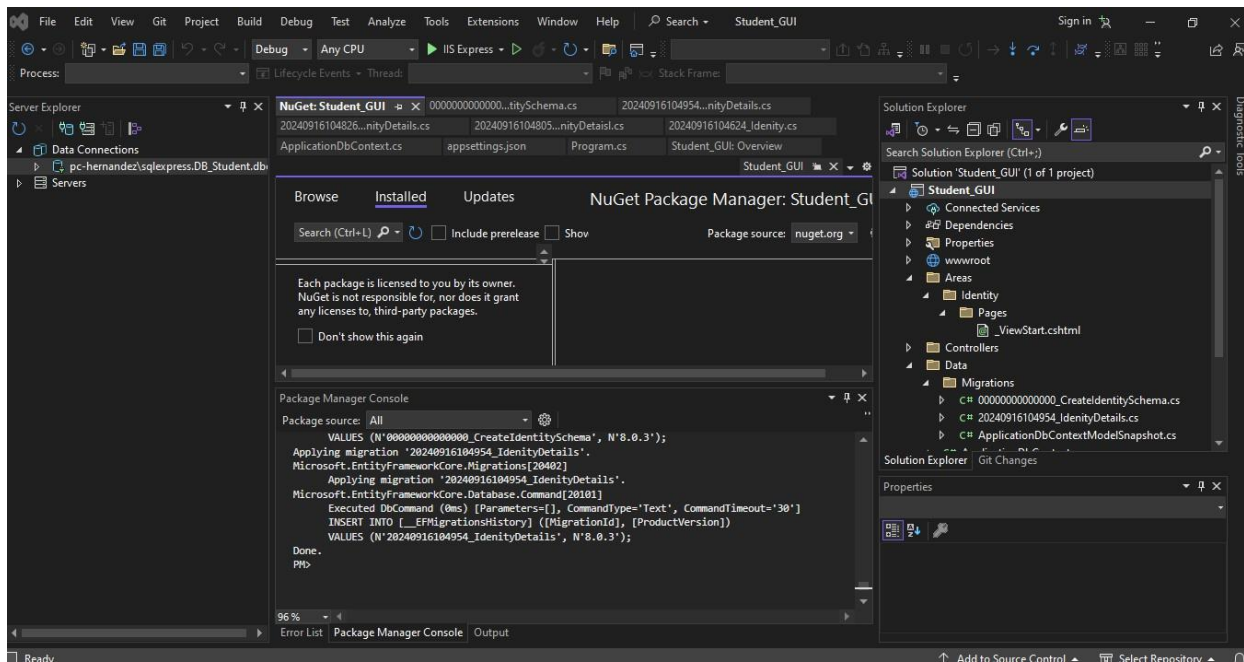

Open the tables

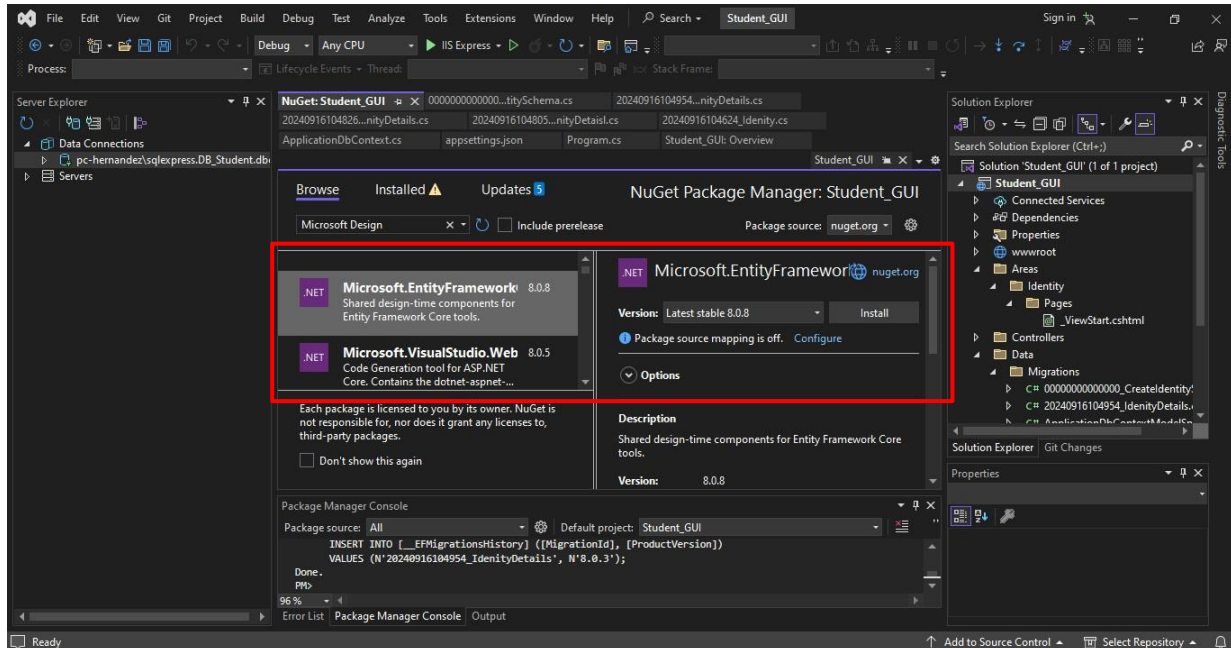

View the each fields

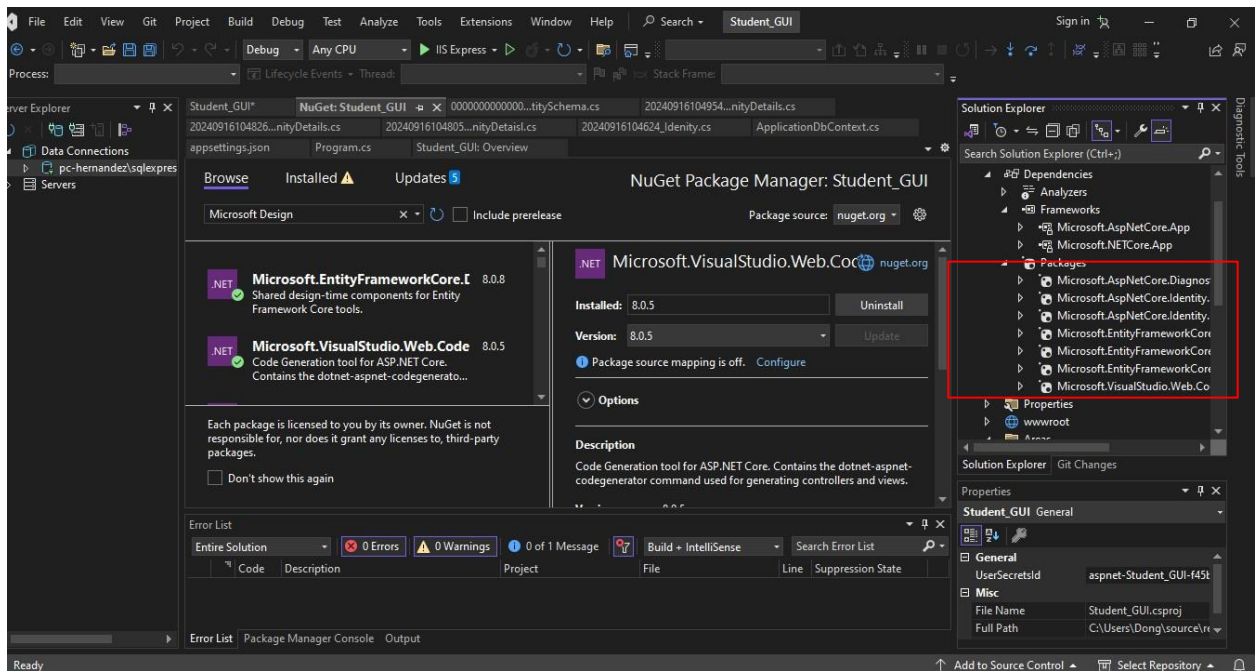

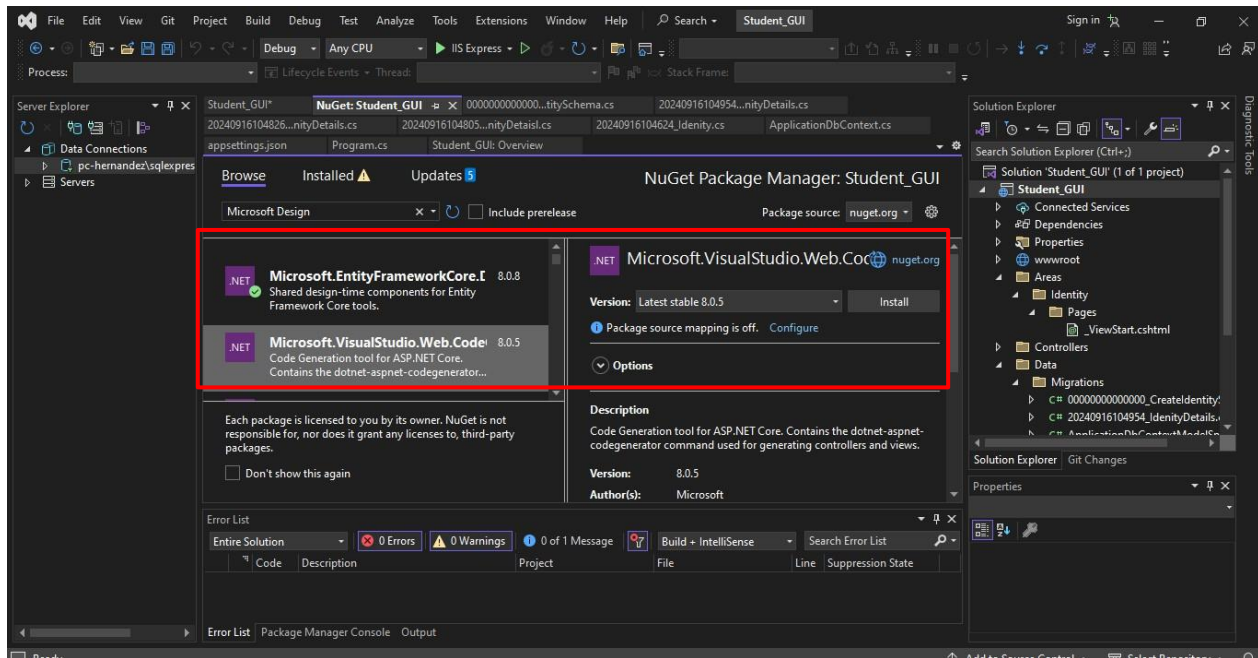

Install Microsoft Entity Framework – Microsoft Design

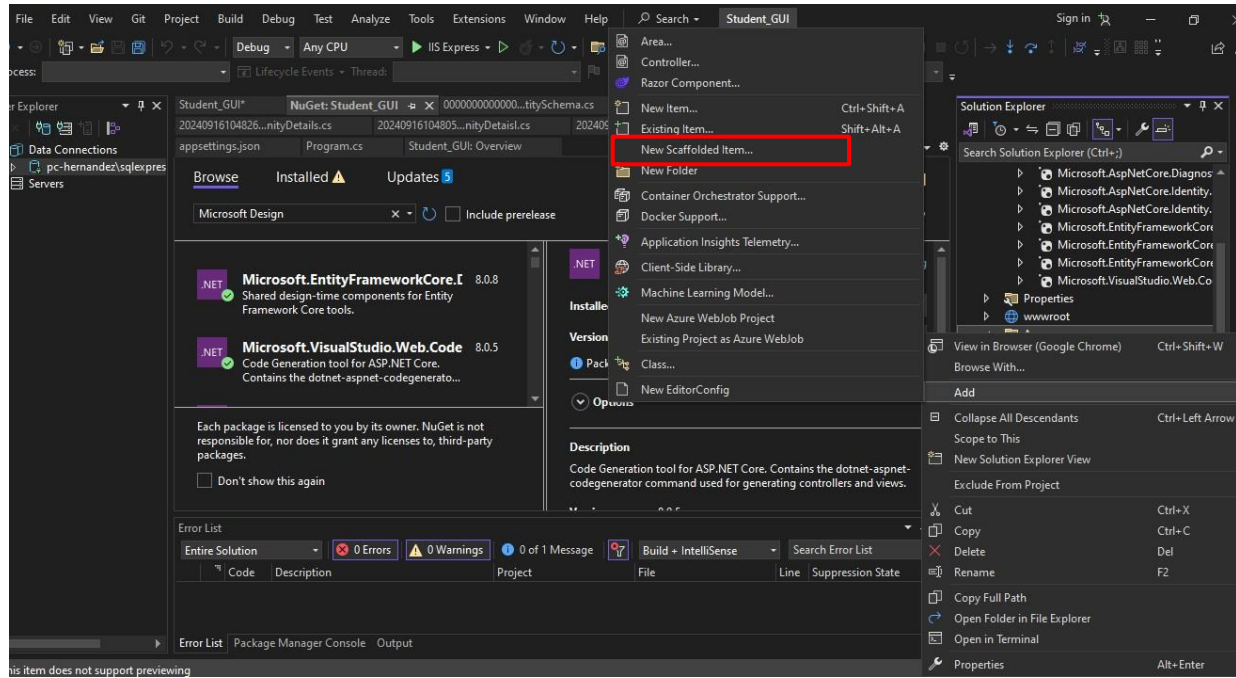

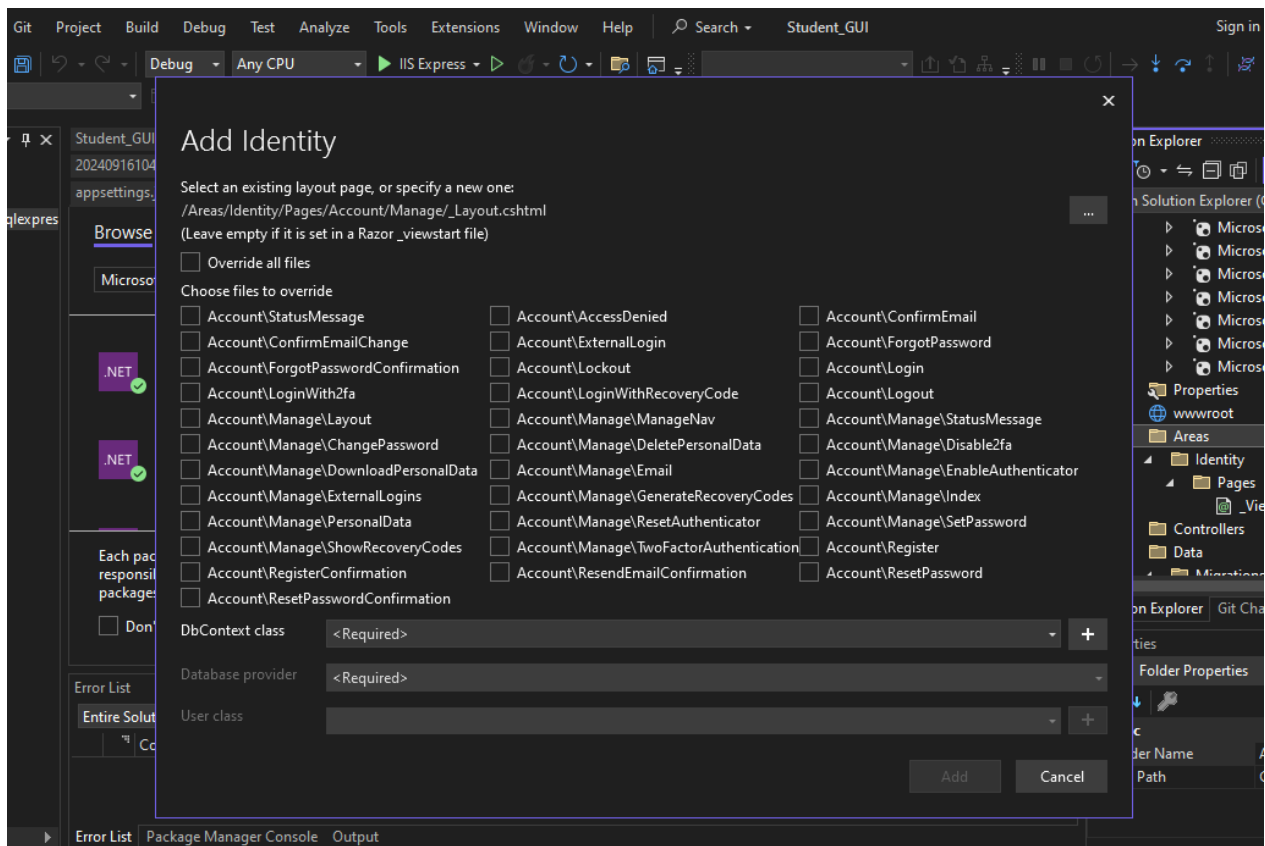

Install Microsoft Visual Web Code

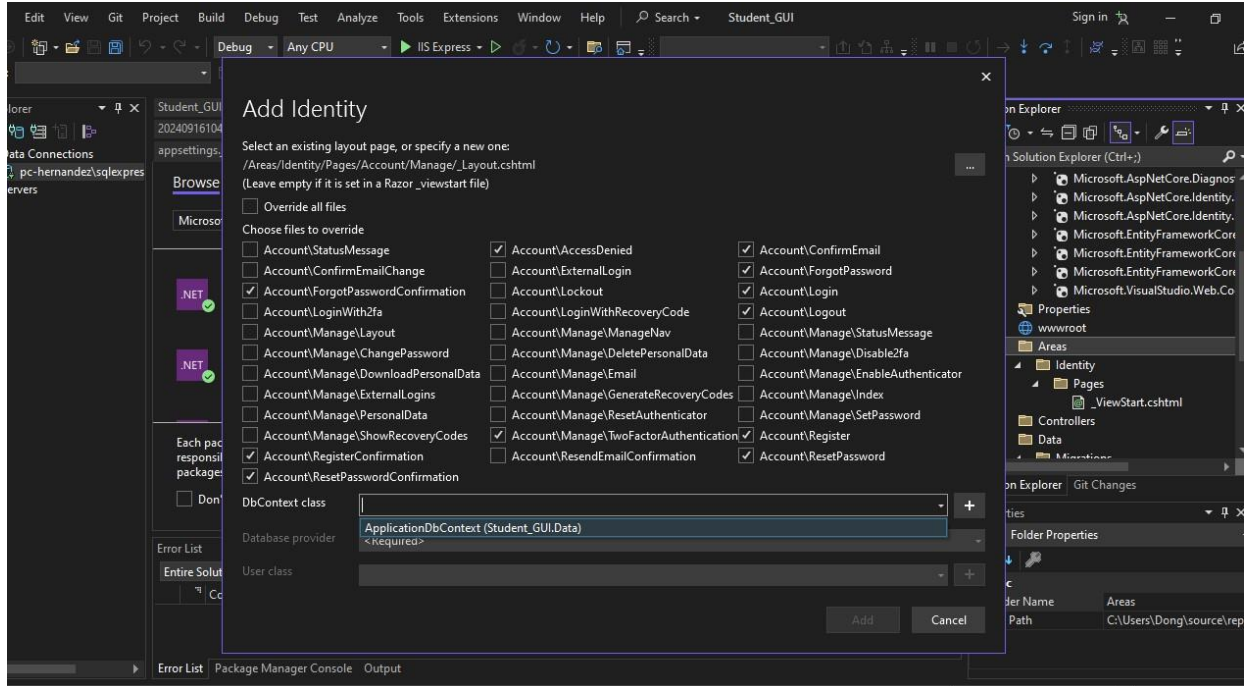

Add **New Scaffolded Item**

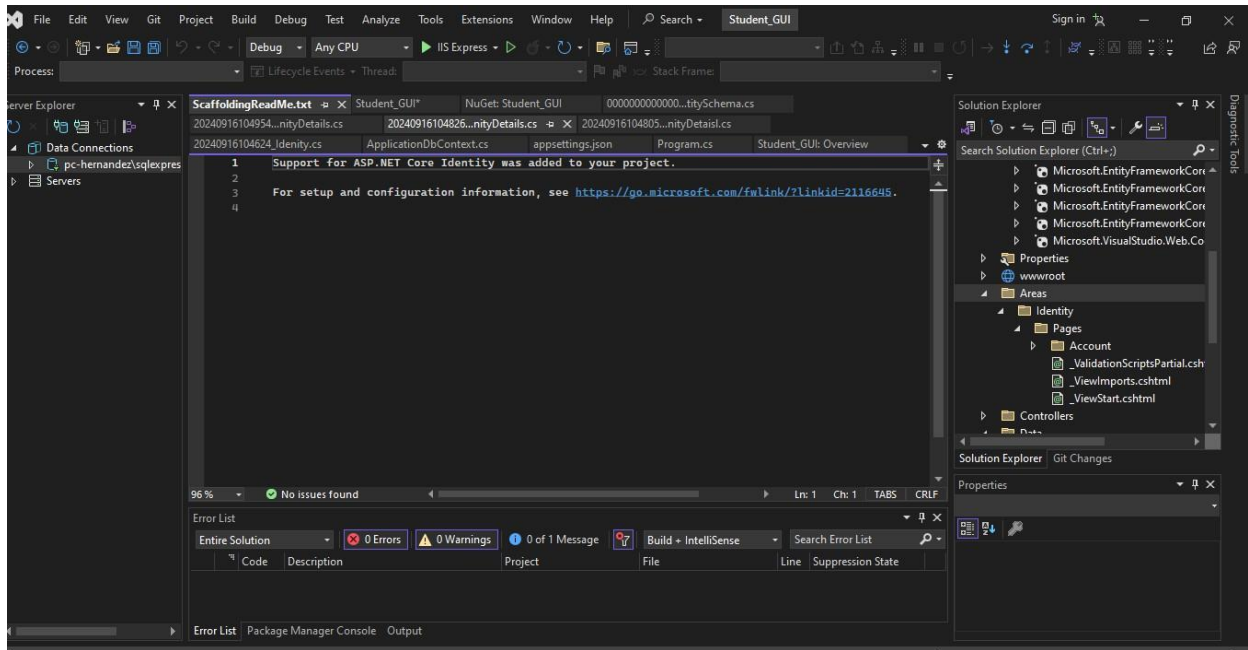

Then Click **Identity**

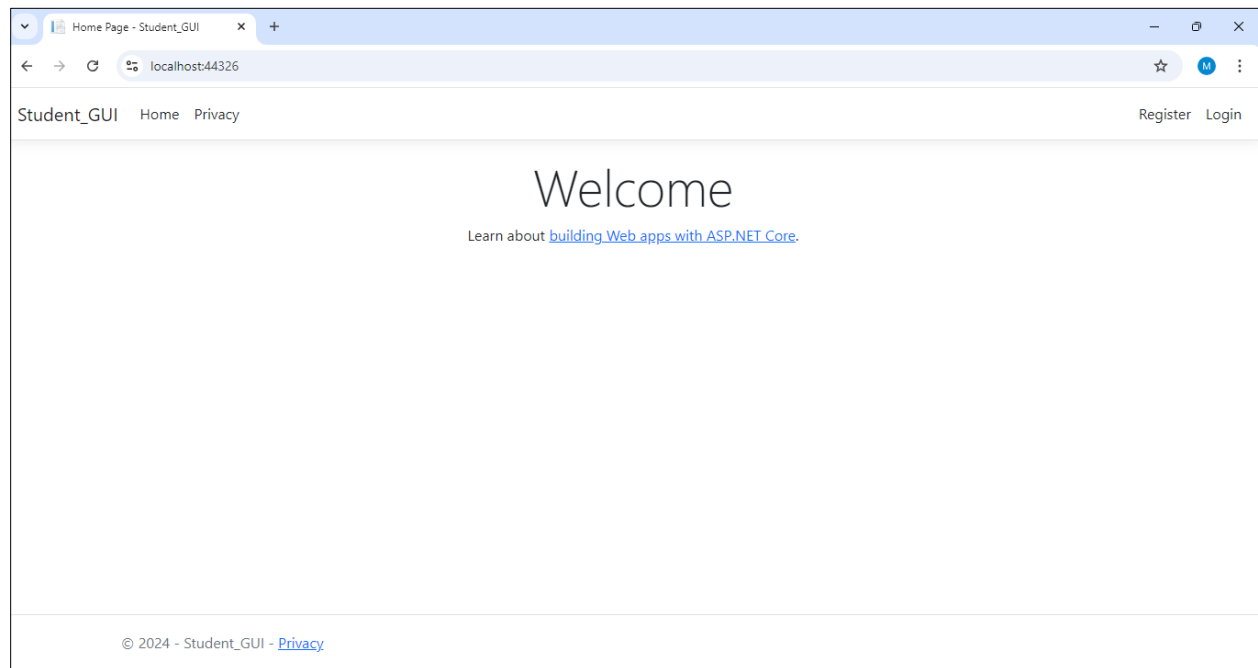

Select the Identity

THE RESULT

Log in - Student_GUI
